

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (previously presented): A telecommunication system comprising:

a first and second terminal;

a switch having a detector and a processor;

a memory for storing at least one message originating from said first terminal and destined for said second terminal, said at least one message being associated with a specific signal generated by said first terminal;

said second terminal comprising:

a generator for generating said specific signal to be sent to said switch, said specific signal indicating that a user of said second terminal is interested in said at least one message associated with said specific signal,

wherein in response to detecting said specific signal, said processor of said switch automatically orders said memory to generate and send said at least one message to said second terminal.

2. (previously presented): The telecommunication system according to claim 1,

wherein said specific signal comprises a destination signal defining a destination of said first terminal or comprises a predefined specific code.

3. (previously presented): The telecommunication system according to claim 1, wherein said first terminal comprises:

a further generator for generating an indication signal to be sent to said switch and identifying at least one message originating from a user of said first terminal being a specific message, said switch further comprising a detector for detecting said indication signal.

4. (previously presented): A telecommunication system according to claim 3, wherein said indication signal comprises at least a predefined indication code or a destination signal defining a destination of said second terminal.

5. (currently amended): A switch for use in a telecommunication comprising:
a memory for storing at least one message originating from a first terminal and destined for a second terminal, said at least one message being associated with a specific signal generated by said first terminal;

a detector for detecting said specific signal originating from said second terminal, specific signal indicating that a user of said second terminal ~~in-is~~ interested in said at least one message associated with said specific signal; and

wherein in response to detecting said specific signal, the processor of said switch automatically orders said memory to generate and send said at least one specific message to said second terminal.

6. (previously presented): The switch according to claim 5, wherein said specific signal comprises at least a predefined specific code or a destination signal defining a destination of said first terminal.

7. (previously presented): The switch according to claim 5, wherein said switch further comprises:

an indication signal detector for detecting an indication signal originating from said first terminal and for identifying at least one message originating from a user of said first terminal being a specific message.

8. (previously presented): The switch according to claim 7, wherein said indication signal comprises at least a predefined indication code or a destination signal defining a destination of said second terminal.

9. (canceled).

10. (previously presented): A method for use in a telecommunication system comprising:

storing at least one message originating from a first terminal and destined for a second terminal in a memory; said at least one message being associated with a specific signal generated by said first terminal;

generating said specific signal to be sent from said second terminal to a switch, wherein said specific signal indicates that a user of said second terminal is interested in said at least one message associated with said specific signal;

detecting, by a switch, said specific signal; and

ordering, automatically in response to detecting said specific signal, said memory to generate said at least one specific message to be sent to said second terminal.

11. (new): The telecommunication system according to claim 1, wherein said specific signal comprises a destination signal defining a destination of said first terminal.

12. (new): A telecommunication system according to claim 3, wherein said indication signal comprises a destination of said second terminal.

13. (new): The switch according to claim 5, wherein said specific signal comprises a destination signal defining a destination of said first terminal.

14. (new): The switch according to claim 7, wherein said indication signal comprises a destination of said second terminal.
